3.3.2.1.- GlassFish 3.1.2.2 (build 5) patches

Version 3.1.2.2 (build 5) of GlassFish may require a patch to solve an issue consisting in the flooding of the server log with an error from the Grizzly HTTP server. This error may consume the CPU resources and cause GlassFish to stop responding, and it has been reported in some scenarios where intermittent network errors occur.

Details of the issue can be found in the following link:

http://www.java.net/forum/topic/glassfish/glassfish/what-causes-grizzly-flood-glassfish-log-messages-interrupting-idle-thread-http-thread-pool-803

In order to solve this issue, two GlassFish files (glassfish-corba-orb.jar and grizzly- http.jar) need to be replaced in folder:

   <GlassFish_home>\modules

(for example C:\glassfish3\glassfish\modules). These modules can be downloaded from

The modules can be downloaded from the following links: glassfish-corba-orb.jar , grizzly- http.jar.
After having replaced the above GlassFish modules, the IPAS domains (if any) must be restarted.
